

# Modeling the Economic Impact of COVID-19

Adam Rose and Dan Wei

Sol Price School of Public Policy  
Center for Risk and Economic Analysis of Terrorism Events  
University of Southern California

March 19, 2020

# Objectives and Overview

- Causal Factors
- Scenario Overview
- Behavioral Considerations
- Resilience
- Review of Our Previous Studies

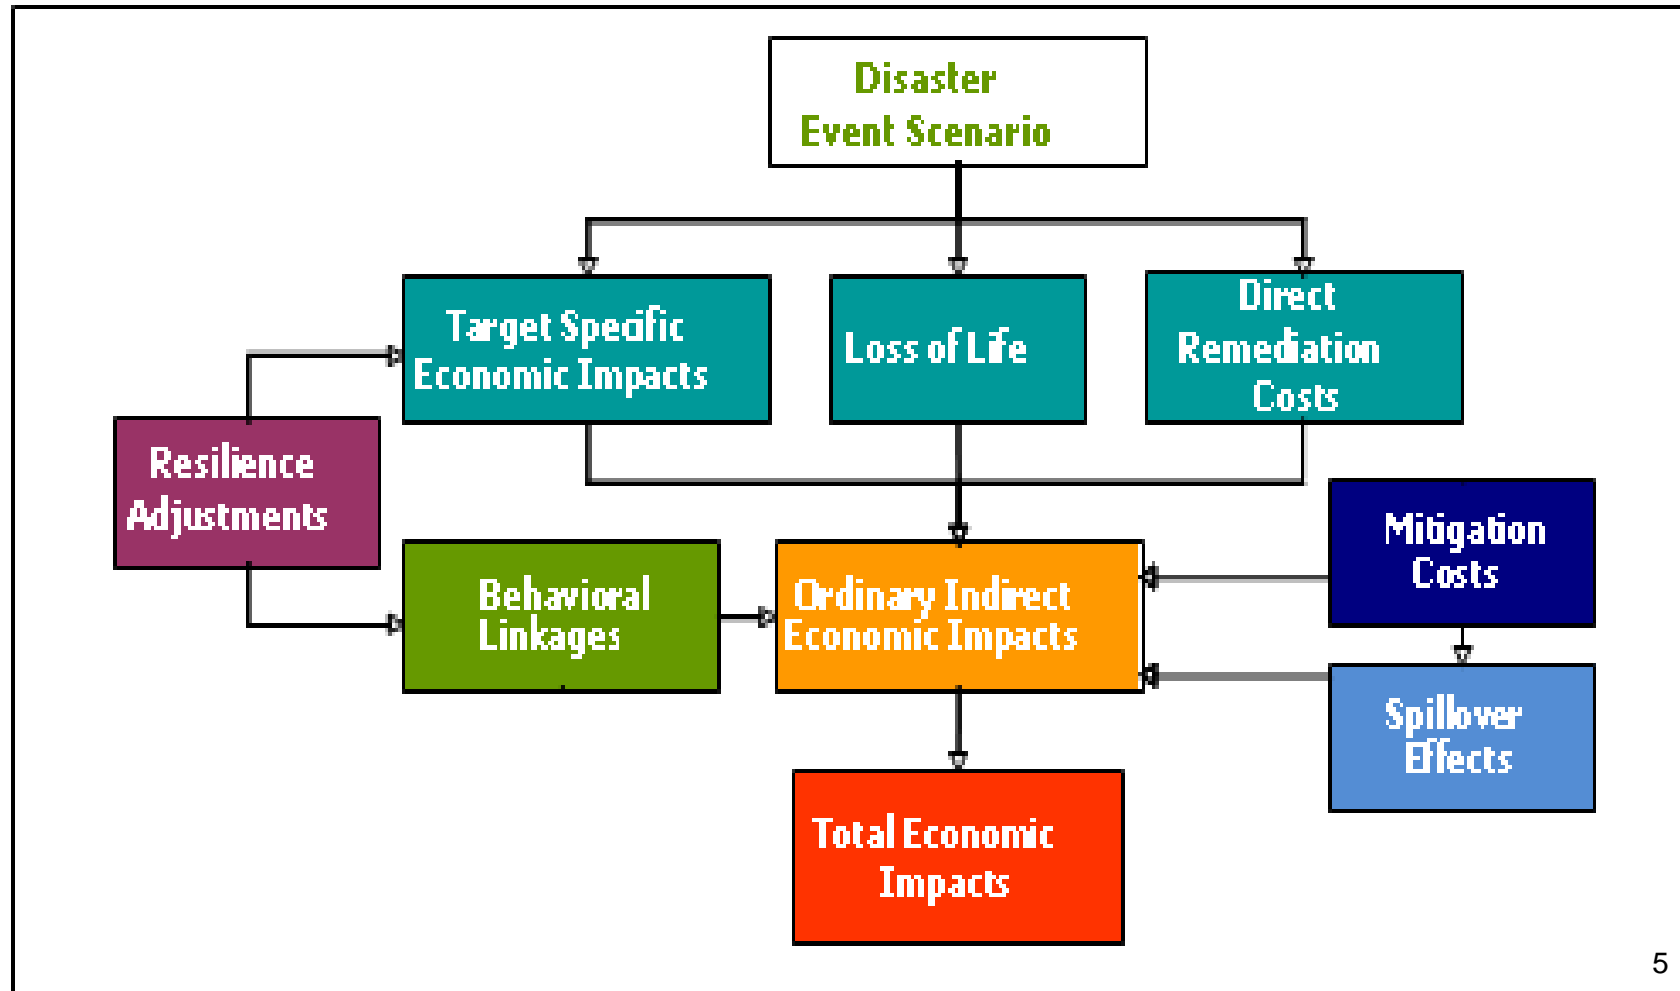

# Causal Factors

- Factors affecting Labor Force Participation
  - death, hospitalization, home care-giving
  - inability to get to work
  - voluntary mandatory business and school closures
  - vaccination
- Factors affecting Supply
  - voluntary mandatory business closures
  - interruption of critical inputs from domestic and foreign sources
- Factors affecting Demand
  - drop in demand for output from both domestic & foreign customers
  - surge sectors (health care, medical supplies, delivery, construction)
- Behavioral Factors (avoidance, panic buying)
- Resilience (telecommuting, production rescheduling)

# Scenarios

Case	Severity & Timing	Avoidance	Vaccination	Import/ Export	Resilience
<b>1.</b>	Mild & Contained (3 months)	minimal	no	delay	high
<b>2a.</b>	Moderate & Slow Onset (6 months)	minimal	no	delay	high
<b>2b.</b>	Moderate & Slow Onset (6 months)	moderate	yes	delay	high
<b>2c.</b>	Moderate & Slow Onset (6 months)	panic	no	disruption partial	moderate
<b>3a.</b>	Pandemic & Exponential (18 months)	moderate	yes	disruption partial	moderate
<b>3b.</b>	Pandemic & Exponential (18 months)	mandatory	no	disruption	low

# CREATE Economic Consequence Analysis Framework

# E-CAT User Interface

National Center for  
 Risk and Economic Analysis of Terrorism Events

## Economic Consequence Analysis Tool (E-CAT) User Interface Version 2.0

Terrorism / Intentional Acts	Natural Threats	Technological Accidents / Infrastructure Failures	Uncertainty Display Options	Go!

Cumulative Distribution of GDP Loss (Value)

Cumulative Distribution of Employment Loss (Value)

Cumulative Distribution of GDP Loss (Percent)

Cumulative Distribution of Employment Loss (Percent)

# Behavioral Linkages

- Off-site responses associated with behavioral changes (business, household, investor, worker)
- Emanates from social amplification of risk & stigma effects (media coverage, rumor)
- Fear feeds on itself and spreads
- Translates into direct and indirect BI losses
- Can be 2 to 3 orders of magnitude higher

# Behavioral Linkage Examples

- 9/11 led to a 2-year reduction in air travel
- Workers fear of riding the subway/bus
- Business fear of staying open after dark
- Investor fear of taking high risk
- General avoidance behavior
- Gov't premature shutdown or evacuation

# Economic Resilience

- **Static:**
  - General Definition: Ability of a system to *maintain function* when shocked.
  - Econ Definition: *Efficient use of remaining resources* at a given point in time to produce as much as possible.
- **Dynamic**
  - General: *Ability & speed* of a system to *recover*.
  - Economic: *Efficient* use of resources *over time* for investment in repair and reconstruction, including expediting the process & adapting to change
- *Metric: averted losses as % of potential losses*

# Measuring Econ Resilience of 9/11

- 95% of over 1,100 WTC area firms relocated after 9/11
- If all of firms in the WTC area went out of business, direct business interruption (BI) loss would = \$58.4B
- If all relocation were immediate, then BI = \$0
- Businesses relocated 2 to 4 months, BI = \$16.1B
- Resilience Metric:  $\text{Avoided Loss} \div \text{Max Potential Loss}$

$$\$42.3\text{B} \div \$58.4\text{B} = 72\%$$

# Total Economic Consequences of an Influenza Outbreak in the United States

Fynnwin Prager, Dan Wei, and Adam Rose

# Broader Context

- **National Biosurveillance Integration Center (NBIC) Project on Value of Economic Information**
- **Broaden the scope of econ consequence analysis**
  - current focus on direct (partial equilibrium) impacts; narrow interpretation of benefit-cost analysis
  - we seek to incorporate ordinary indirect impacts
- **Also include new set of impacts**
  - behavioral linkages (fear leading to avoidance/aversion)
  - resilience (actions that maintain economic function & accelerate recovery)

# Simulation Scenarios

- Case 1: No Vaccination, Seasonal Outbreak
- Case 2: No Vaccination, Pandemic Outbreak
- Case 3: Vaccination, Seasonal Outbreak
- Case 4: Vaccination, Pandemic Outbreak

# Direct Impacts (Case 4)

Impact Category	USCGE Modeling Approach	Level Impact <sup>a</sup>	% Impact
Workforce Participation	Reduction in labor workforce participation	-68.5M	-0.31%
Medical Expenditures	Increase household spending on medical services	\$65.59B	3.79%
Avoidance Behavior	Staying home from work (reduction in labor workforce participation)	-\$8.09B	-0.09%
	Keeping children from school (reduction in attendance of educational facilities)	-\$0.45B	-0.13%
	Keeping children from school (caregiver avoidance; reduction in labor workforce participation)	-\$0.77B	-0.01%
	Reduction in Inbound International Travel	-\$11.94B	-14.88%
	Reduction in Outbound International Travel	-\$5.92B	-14.88%
	Reduction in Domestic Travel/Leisure Activities	-\$15.54B	-2.34%
	Reduction in Public Transportation Use	-\$140.36M	-2.34%
Economic Resilience	Recapture Production thru Overtime or Extra Shifts	27.4M	0.19%

<sup>a</sup> If not dollars; person work-days

# Magnitude and Length of Avoidance Behaviors

<b>Avoidance Responses</b>	<b>Literature Review Findings</b>	<b>Direct Impacts Adapted from the Literature</b>	<b>Adapted Values Used in the Analysis (Case 4)</b>
Staying home from work	60% avoid, 1 week	-1.25%	-0.09%
Keeping children from school (education sector impacts)	60% avoid, 1 week	-1.67%	-0.13%
Keeping children from school (caregiver avoidance)	60% avoid, 1 week	-1.25%	-0.01%
Avoiding medical professionals	22% avoid, 1 month	-1.83%	N/A
Reducing shopping	69% avoid, 1 month	-5.75%	N/A
Avoiding entertainment venues	75% avoid, 5 months	-31.25%	-2.34%
Avoiding public transportation	75% avoid, 5 months	-31.25%	-2.34%
Rescheduling travel plans	16% avoid, 5 months	-6.67%	N/A

# GDP Impacts on the U.S. Economy

(billions of 2012 dollars)

Results	No Vaccination		Vaccination	
	Seasonal	Pandemic	Seasonal	Pandemic
GDP impacts (without avoidance and without resilience)	-4.95	-25.40	-4.71	-19.94
Avoidance impacts	-6.19	-33.39	-4.59	-25.12
Resilience impacts	2.22	13.47	2.31	10.63
Summation	-8.92	-45.32	-6.99	-34.43

# Aggregate Impacts on the U.S. Economy (with & without recapture)

Direct Impact	Case	Direct Impacts to GDP (\$B)	Total Impact on GDP		Employment ('000s Jobs)	
			Level (\$B)	%	Level	%
Summation (no recapture)	Case 1	-4.1	-11.2	-0.07	-88	-0.12
	Case 2	-5.6	-58.8	-0.36	-464	-0.56
	Case 3	-0.8	-9.3	-0.06	-73	-0.10
	Case 4	-2.3	-45.1	-0.28	-356	-0.43
Summation (with recapture)	Case 1	-2.8	-8.9	-0.06	-70	-0.09
	Case 2	2.2	-45.3	-0.28	-358	-0.41
	Case 3	0.6	-7.0	-0.04	-55	-0.07
	Case 4	3.9	-34.4	-0.21	-272	-0.31

# Conclusions

## Direct impacts

- Mild outbreak has net negative direct impacts
- Severe outbreak net positive: +ive medical spending
- Vaccination impact is twofold: 1) reduces medical treatment expenditure and illness related workday losses; 2) incur medical cost and workday lost itself

## General equilibrium impacts

- Mild and Severe outbreaks negative impacts: hh budget constraints and substitution reduce direct impacts
- Vaccination is more effective to reduce GDP and employment impacts in Pandemic Outbreak scenario

# Policy Implications

- Behavior is key factor
  - avoidance and aversion behavior
  - gov't policy and public health officials can focus on influencing behavior thru risk messaging
- Resilience is significant but less so
  - business (labor) production recapture
  - encourage flexible working hours can help

# **Macroeconomic Impacts of Shutting Down the U.S. Borders to a Security or Health Threat**

Adam Rose, Garrett Asay, Dan Wei, and Billy Leung

# Impact Categories Modeled

- Halt in all imports from rest of the world
- Border cessation of all U.S. exports
- International travel ban outbound & inbound traffic
- Halt of documented & undocumented migrants

# Trade Simulations

- Export closure -- straightforward
- Import closure -- complicated
  - REMI assumes full domestic substitution
  - doesn't automatically assume price increases
- Export-Import interaction
  - could divert exports to sub for imports; however, not perfectly substitutable
  - REMI cannot distinguish export diversion from domestic substitution anyway

# Export Closure Results

Economic Indicator	Difference from Baseline	
	Level	Percent
Employment (thousands)	-17,240	-9.9
GDP (billion 2000\$)	-1,360	-11.9
CPI	-0.82	-0.73

# Export Closure Results, Sectoral

Sector	Difference from Baseline <sup>a</sup>			
	Direct Effect		Total Effect	
	Level	Percent	Level	Percent
Computer, electronic prod mfg	-173.49	-27.78	-215.9	-34.57
Chemical mfg	-69.27	-14.96	-111.2	-24.01
Machinery mfg	-65.40	-23.76	-81.17	-29.49
Motor vehicle mfg	-65.31	-13.67	-107.8	-22.56
Food mfg	-19.92	-4.52	-59.92	-13.60
Primary metal mfg	-12.86	-9.10	-44.92	-31.77
Total	-988.99	-5.60	-2,602.86	-14.74
Implicit multiplier (total effect /direct effect)			2.63	

<sup>a</sup> in billion 2000 dollars

# Export Closure Results

- A border shutdown of all exports results in significant negative impacts on the U.S. economy due to the loss of demand from foreign markets.
- An associated import reduction of around 12%
  - reduction in inputs demand from the international market due to decrease in production for exports

# Import Closure Inputs

- Assume loss in import is compensated by the use of excess capacity at the level of 20%
- Estimate sectoral production cost increases
  - Estimate import replacement gap after the use of excess capacity for each REMI sector
  - Estimate price differentials between imported goods and their domestic substitutes for REMI sectors that have import replacement gap
  - Estimate sectoral production cost increase based on proportion of total import value of GDP for the sector

# Import Closure Results

Assume import replacement by utilizing excess capacity at the level of 20%

Economic Indicator	Difference from Baseline	
	Level	Percent
Employment (thousands)	-19,040	-10.99
GDP (billion constant 2000\$)	-666.3	-5.82
CPI	32.33	29.02

# Import Closure Results

- A closure of all imports will cause significant negative impacts to the U.S. economy.
- Negative impacts from production cost increase more than offsets the positive impacts from increased demand for domestic substitutes.

# International Travel

- Simulated costs associated w/ cutoff of international travel to & from U.S.
- Input values based on:
  - Travel Industry Association of America (2002)
  - Bureau of Transportation Statistics (2005)
    - International visitors in 2005 spent \$88.1 billion
    - U.S. & foreign citizens spent \$49.5 billion on airline tickets

# International Travel Results

Economic Indicator	Difference from Baseline	
	Level	Percent
Employment (thousands)	-3,375	-1.95
GDP (billion constant 2000\$)	-175	-1.53
CPI	-0.17	-0.15

Most negatively impacted sectors include Air Transportation, Accommodation, and Food Services and Drinking Places

# Migration Results

Economic Indicator	Difference from Baseline			
	Documented		Undocumented	
	Level	Percent	Level	Percent
Employment (thousands)	-277	-0.16	-393	-0.23
GDP (billion constant 2000\$)	-18	-0.16	-24	-0.21
CPI	0.02	0.02	0.27	0.24
Population (thousands)	-1012	-0.34	-0.031	-0.03

# All Cross-border Activities Shutdown -- Simple Summation

Assume import replacement by utilizing excess capacity at the level of 20%

Economic Indicator	Difference from Baseline				Total
	Imports	Exports	Travel	Migration	
Employment (thousands)	-19,040	-17,240	-3,375	-671	-40,326
GDP (\$B)	-666	-1,360	-175	-43	-2,243
CPI	32.33	-0.82	-0.17	0.29	31
Population (thousands)	*	*	*	-1,012	-1,012

# All Cross-border Activities Shutdown -- Simultaneous Simulation

- Estimate the economic impacts on the U.S. economy of a one year border closure for all goods & people
- Simultaneously utilize all the inputs in individual border closure cases in REMI Model
- Assume import replacement by utilizing excess capacity at the level of 20% plus Export Diversion

# All Cross-border Activities Shutdown -- Simultaneous Simulation Results

Assume import replacement by utilizing excess capacity at the level of 20% plus Export Diversion

Economic Indicator	Difference from Baseline	
	Level	Percent
Employment (thousands)	-22,130	-12.77
GDP (billion constant 2000\$)	-1,194	-10.44
CPI	16.68	14.98
Population (thousands)	-1,012	-0.3

# Conclusions

- A one-year border shutdown likely to lead to U.S. GDP losses of \$1.4 trillion (2006\$), or about a 10.5% reduction and employment losses of 22 million, or more than 12% below base level.
- Two largest negative components are export and import shutdowns
- Estimates should be considered upper bounds.
